

HYGROS-TEC III

Automatic Dampening System

Developed with the function of determining the percentage of humidity and the payload of the product. The featured sensor can instantaneously determine the electrolytic weight, the temperature and the dielectric constant of the product entering the machine, in order to determine the percentage of water present in the product. A dedicated electronic device with a microprocessor determines the quantity of water addition needed to obtain the final percentage of desired humidity. Thanks to a dedicate software, the machine can memorize different working programs.
